

ABSTRACT OF THE DISCLOSURE

A generally u-shaped implement forming the stimulation aid comprises a handle and a penetrative shaft connected at their respective proximal ends. An inner face of the handle has a series of ribs for clitoral and labial stimulation. A rounded distal end of the penetrative shaft is curved inwardly to stimulate the "G-spot". The aid is operable manually, using a rocking motion. In some embodiments, it is vibrated and/or pulsed using an electric motor, embedded within the device or inserted into a recess provided for it.
